Session Overview

- Connecting to SQL Pools
- Using **Serverless SQL Pools** to load external data
- Creating Materialized Views in **Dedicated SQL Pools**
- Further reading

Connecting to SQL Pools

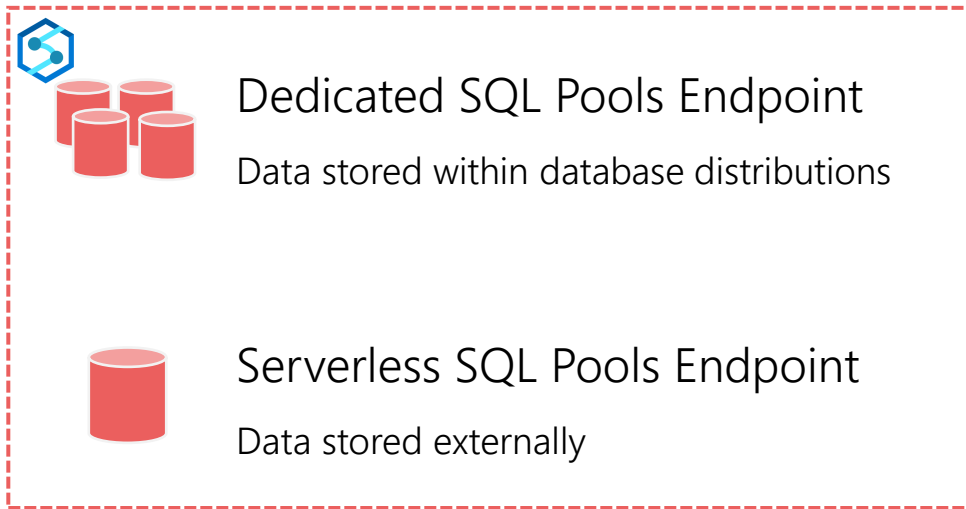

Both **Dedicated SQL Pools** and **Serverless SQL Pools** expose a SQL endpoint which external tools can connect to.

Dedicated SQL endpoint : `synapse.sql.azure.synapse.net`

Serverless SQL endpoint : `synapse-ondemand.sql.azure.synapse.net`

Using Serverless SQL Pools to load external data

We can connect to **CSV, JSON, & Parquet file data in Azure Storage** using Serverless SQL Pools and run SQL queries on this data.

Azure Blob Storage and Data Lake Gen1/2

```
CREATE VIEW LDW.vwSalesOrdersAggregates
AS
SELECT SalesOrderID,
       OrderDate,
       CustomerID,
       SUM(OrderTotal) AS TotalOrderAmount
FROM
OPENROWSET
(
  BULK 'sourcedatapartitionsalesorder/**/*.csv',
  DATA_SOURCE = 'ExternalDataSourceDataLake',
  FORMAT = 'CSV',
  PARSER_VERSION = '2.0',
  HEADER_ROW = TRUE,
  FIELDTERMINATOR = '|'
) AS fct
GROUP BY SalesOrderID,
         OrderDate,
         CustomerID
```

DirectQuery or Import

Power BI Desktop/Dataflows

Connect to External Tables and Views and run SQL via Power BI. Power BI can use **Query Folding** to push SQL to Serverless SQL Pools

Scenarios include **aggregating large source data** for loading into Power BI.

Creating Materialized Views in Dedicated SQL Pools

We can create a **Materialized View** in Dedicated SQL Pools to pre-calculate and store dataset ready for use in Power BI.

Data stored within
Dedicated SQL Pools
databases

```
CREATE MATERIALIZED VIEW vwCustomerSalesAnalysis
WITH (DISTRIBUTION=HASH(customer id))
AS
SELECT DC.customer_id AS customer_id
      ,DC.first_name AS customer_first_name
      ,DC.last_name AS customer_last_name
      ,DD.[year] AS SalesYear
      ,sum(isnull(ss_ext_list_price-ss_ext_wholesale_cost
                -ss_ext_discount_amt+ss_ext_sales_price, 0)/2) year_total
      , count_big(*) AS Sales
FROM DW.DimCustomer DC
INNER JOIN DW.FactSales FS ON FS.customer_id = DC.customer_id
INNER JOIN DW.DimDate DD ON DD.DateKey = FS.SalesDateKey
GROUP BY DC.customer_id
        ,DC.first_name
        ,DC.last_name
        ,DD.[year]
```

DirectQuery
or Import

Power BI
Desktop/Dataflows

Scenarios include **complex logic calculation** with data stored in Dedicated SQL Pools.
